

TaskFlow

Getting Started: Your Onboarding Guide

Follow these steps to go from signup to a fully running workspace in under 30 minutes.

1

Create Your Account

Head to taskflow.example.com/signup and register using your email address, or sign up instantly with Google or Microsoft. Verify your email by clicking the confirmation link we send, which activates your account within seconds. You'll be prompted to set a password and enter your name and role, which helps us tailor your onboarding experience. No credit card is required to get started, so you can explore freely on the Free plan.

2

Set Up Your First Workspace

A workspace is your team's home base in TaskFlow, where all projects, tasks, and members live together. Give it a name (like your company or team name), choose an icon or color, and select your industry so we can suggest relevant templates. You can create additional workspaces later if you manage multiple teams or clients. This setup takes less than a minute and can be edited anytime from Workspace Settings.

3

Customize Your Workspace Settings

Before diving in, take a moment to configure a few basics: set your timezone, default working hours, and preferred date format under Workspace Settings > Preferences. You can also choose a default view — list, board, or calendar — for how tasks appear across your projects. These small adjustments make TaskFlow feel tailored to your team from day one. Don't worry about getting everything perfect; all settings can be changed later.

4

Invite Your Team Members

Go to Workspace Settings > Members and click "Invite People" to add teammates by email address. Assign each person a role — Admin, Member, or Viewer — depending on how much access they need. Invited users receive an email with a link to join your workspace directly, and you can track pending invitations from the same screen. Adding your team early means everyone can start collaborating right away instead of working in silos.

5

Create Your First Project

Click "New Project" from your dashboard and give it a name, description, and optional due date. Choose a project template — such as Sprint Planning, Marketing Campaign, or Simple To-Do List — or start from a blank board if you prefer full control. Add the team members who'll be working on it, and set the project to Private or Team-visible depending on who should see it. Your project is now ready for tasks.

6

Add and Organize Your First Tasks

Inside your new project, click "Add Task" to create your first to-do item, then fill in details like assignee, due date, priority, and labels. Break larger tasks into subtasks to keep work manageable, and use comments to keep context and discussion attached to the right item. Drag and drop tasks between columns (like To Do, In Progress, and Done) to visually track progress on your kanban board. This is also a great time to try out filters and sorting to see how you like to organize your view.

7

Connect Your Favorite Integrations

Visit the Integrations tab in Workspace Settings to connect tools your team already uses, like Slack, Google Calendar, GitHub, or Zoom. Connecting Slack lets you receive task notifications and create tasks directly from a channel, while the Google Calendar integration syncs task due dates so nothing slips through the cracks. Each integration takes just a couple of clicks to authorize and can be customized or disconnected anytime. We recommend starting with one or two integrations rather than connecting everything at once.

8

Explore Reporting and Automation

Once you've got a few tasks moving, check out the Reports tab to see progress charts, workload distribution, and upcoming deadlines at a glance. Try setting up your first automation rule — for example, automatically notifying a channel when a task moves to "Done" — from the Automations panel. These tools become more valuable as your workspace grows, so it's worth exploring them early even if you don't need them on day one. You're now fully set up and ready to run your projects in TaskFlow.

Tips for New Users

- Start small: set up one real project first rather than trying to migrate everything on day one.
- Use keyboard shortcuts (press "?" anywhere in TaskFlow) to speed up task creation and navigation.
- Pin your most-used projects to the sidebar so they're always one click away.
- Encourage your team to turn on desktop or Slack notifications so updates don't get missed.

- Revisit your workspace settings after a couple of weeks — your ideal setup often becomes clearer with real use.
- Bookmark the Help Center (help.taskflow.example.com) for quick answers whenever you get stuck.
