

TaskFlow

Troubleshooting & Help Center

Quick fixes for the most common issues our users run into.

1. Can't Log In

THE ISSUE

You're entering your credentials but TaskFlow won't let you into your account, or you're stuck on a loading or error screen.

TROUBLESHOOTING STEPS

- 1 Double-check that you're using the correct email address, especially if you have multiple TaskFlow accounts or sign in via Google/Microsoft.
- 2 Click "Forgot Password" on the login screen to request a reset link, then check your inbox (and spam folder) for the email.
- 3 Clear your browser's cache and cookies, or try logging in from an incognito/private window to rule out a stored session conflict.
- 4 Confirm your account hasn't been deactivated by an admin — ask your workspace Owner to check Workspace Settings > Members.
- 5 If none of the above works, contact support@taskflow.example.com with your account email so we can investigate directly.

2. Notifications Not Working

THE ISSUE

You're not receiving email, in-app, or Slack notifications for task updates, mentions, or due dates.

TROUBLESHOOTING STEPS

- 1 Check Account Settings > Notifications to confirm the relevant notification types (mentions, due dates, comments) are toggled on.
- 2 Verify your email address is confirmed and not bouncing — an unverified address can silently block email alerts.
- 3 If using the Slack integration, make sure it's still connected under Integrations > Slack and that you haven't muted the TaskFlow app in Slack itself.
- 4 Check your browser or device settings to ensure notifications aren't being blocked at the system level for in-app/push alerts.
- 5 Try triggering a test notification (e.g., assign yourself a task) to confirm whether the issue is account-wide or specific to one project.

3. Integration Not Syncing

THE ISSUE

A connected tool, such as Slack, Google Calendar, or GitHub, isn't reflecting updates made in TaskFlow, or vice versa.

TROUBLESHOOTING STEPS

- 1 Go to Integrations in Workspace Settings and confirm the integration shows a "Connected" status rather than an error or expired badge.
- 2 Disconnect and reconnect the integration to refresh the authorization token, which resolves most sync issues.
- 3 Check that the specific project or channel you expect to sync is actually selected in the integration's configuration.
- 4 Allow a few minutes for syncing, as some integrations (like Google Calendar) update on a short delay rather than instantly.
- 5 If syncing still fails, check the integration's status page for outages, or contact support with the integration name and affected project.

4. Billing Charge Issue

THE ISSUE

You were charged an unexpected amount, charged twice, or billed after canceling your subscription.

TROUBLESHOOTING STEPS

- 1 Review your Invoice History under Account Settings > Billing to see exactly what was charged and for which billing period.
- 2 Confirm your subscription status and renewal date in Account Settings > Billing > Manage Subscription to rule out an auto-renewal you weren't expecting.
- 3 If you canceled recently, check the cancellation confirmation email to verify the date it took effect, since charges before that date are expected.
- 4 For duplicate or clearly incorrect charges, contact our billing team at billing@taskflow.example.com with your invoice number.
- 5 Refund requests are typically reviewed and resolved within 5 business days once submitted.

5. Can't Invite a Team Member

THE ISSUE

You're trying to add a new person to your workspace, but the invitation won't send or the recipient never receives it.

TROUBLESHOOTING STEPS

- 1 Confirm you have Admin or Owner permissions, since only those roles can send workspace invitations.
- 2 Check that your workspace hasn't hit its seat limit for your current plan — Free and Starter plans have a maximum number of users.
- 3 Double-check the invitee's email address for typos, and ask them to check their spam or promotions folder for the invite email.
- 4 Resend the invitation from Workspace Settings > Members, which generates a fresh invite link in case the original expired.
- 5 If the issue persists, try inviting from a different browser, or contact support to confirm the invite was actually sent from our system.

6. File Upload Failing

THE ISSUE

Attachments won't upload to a task or comment, or the upload appears to hang and never completes.

TROUBLESHOOTING STEPS

- 1 Check that your file is under the size limit for your plan (25MB on Free/Starter, 250MB on Professional/Enterprise).
- 2 Confirm your internet connection is stable, and try uploading a small test file to see if the issue is connection-related.
- 3 Try a different file format if possible, as certain rare or proprietary file types aren't currently supported.
- 4 Clear your browser cache or try a different browser, since outdated cached files can occasionally interfere with uploads.
- 5 If uploads consistently fail across files and browsers, contact support with the file type and size so we can check for account-level storage limits.

7. App Running Slow

THE ISSUE

TaskFlow feels sluggish, boards take a long time to load, or actions like dragging tasks lag noticeably.

TROUBLESHOOTING STEPS

- 1 Check how many tasks and boards are loaded in your current view — very large projects (1,000+ tasks) can slow rendering; try filtering or archiving completed items.
- 2 Close unused browser tabs and extensions, as ad blockers or heavy extensions can sometimes conflict with web apps like TaskFlow.
- 3 Make sure you're on an up-to-date browser version, since older browsers can struggle with modern web performance features.
- 4 Test your internet connection speed, as slow or unstable connections can make even lightweight actions feel delayed.
- 5 If performance issues persist across devices and networks, check our Status Page for ongoing incidents or contact support.

8. Data Not Saving

THE ISSUE

Changes to tasks, comments, or project settings don't appear to be saved, or revert after refreshing the page.

TROUBLESHOOTING STEPS

- 1 Check your internet connection — TaskFlow saves changes in real time, so a dropped connection can prevent updates from syncing.
- 2 Look for a small "saving" or "synced" indicator near the top of the screen to confirm whether changes are being registered.
- 3 Avoid editing the same task in multiple browser tabs or devices simultaneously, as this can occasionally cause conflicting updates.
- 4 Refresh the page after a stable connection is restored to confirm whether the change actually saved on our servers.
- 5 If specific data is still missing after refreshing, contact support immediately with the project and task name so we can check our backups.

Still stuck? Reach out to our support team at support@taskflow.example.com — we're here to help.
